

Average tree canopy cover, heat vulnerability index and urban heat island of suburbs in Greater Sydney

Data sources and summary

Average tree canopy cover range (%)

Source data: Greater Sydney Region Tree Canopy to Modified Mesh Block 2019, State Government of NSW and Department of Planning and Environment, 2021

The source data provides both an area and percentage of canopy in the Greater Sydney Region at a small scale (modified mesh block).

Description: The source data has been adapted to calculate the average canopy cover data at the suburb level. The suburb averages in Table 1 have been categorised into the following ranges of average canopy cover: 0-10%, 10-20%, 20-30%, 30-40%, and 40-100%. Those suburbs in the range 0-10% have very low canopy cover, and those in the range 40-100% have high to very high tree canopy cover.

Average heat vulnerability index*

Data source: NSW Heat Vulnerability Index to ABS Statistical Area Level 1 2016, State Government of NSW and Department of Planning and Environment, 2019.

The source data identifies areas that are more vulnerable to the adverse effects of urban heat, using indicators for exposure, sensitivity and adaptive capacity to calculate an overall heat vulnerability index. A vulnerability index of 1 represents a combination of low exposure, low sensitivity and/or high adaptive capacity. A vulnerability of 5 represents high exposure, high sensitivity and/or low adaptive capacity.

Description: The source data has been adapted to calculate the average heat vulnerability index from 0 – 5, at the suburb level, rounded to the nearest whole number. Averaging the heat vulnerability index at a suburb level has resulted in some scores of 0. Suburbs with an index of 0 and 1 are less vulnerable to urban heat than those suburbs with a 5 which are highly vulnerable to urban heat.

Average urban heat island*

Source data: NSW Urban Heat Island to Modified Mesh Block 2016, State Government of NSW and Department of Planning and Environment, 2019.

The source data measures the effects of urbanisation on land surface temperatures across Sydney Greater Metropolitan Area. It maps the deviation of temperature (in degrees Celsius) to a non-urban vegetated reference area, such as heavily wooded areas or national parks around Sydney.

Description: The source data has been adapted to calculate the average urban heat island (in degrees Celsius) at the suburb level, rounded to the nearest whole number. Suburbs in Table 1 range

from -2 to 10°C, with those -2 °C being cooler than non-urban vegetated reference areas, and those with 10 °C being significantly hotter than the non-urban reference areas.

*Data is unavailable for some suburbs and is shown as N/A in Table 1; this is due to the geographic extent of the dataset, which includes ABS-designated major urban, other urban and peri-urban areas of the Greater Sydney Region, but it excludes many rural areas on the periphery of Greater Sydney.

Table 1: Average tree canopy cover, heat vulnerability index, and urban heat island by Greater Sydney suburb

Suburb	Average tree canopy cover range (%)	Average heat vulnerability index (0-5)*	Average urban heat island (°C deviation)*	Suburb	Average tree canopy cover range (%)	Average heat vulnerability index (0-5)*	Average urban heat island (°C deviation)*
